MAJOR AREAS OF RESEARCH INTEREST

Research Areas

1. Health Behavior Change
2. Real-Time Data Capture Methodology
3. mHealth Research
4. Ecological Momentary Assessment (EMA)

5. Impact of Social and Environmental Factors on Physical Activity and Dietary Behaviors
6. Health Promotion and Chronic Disease Prevention

Research in Progress

1. Investigating Microtemporal Processes Underlying Health Behavior Adoption and Maintenance
2. Affective Influences on Cancer Control Behaviors
3. Maternal Stress and Children's Obesity Risk
4. Novel Statistical Models for EMA Studies of Physical Activity
5. Stress and Pregnancy-Related Weight Outcomes

GRANT SUPPORT - CURRENT:

PRINCIPAL INVESTIGATOR

1. U01HL146327. (Dunton, Intille) 8/15/2018-7/31/2022
NIH/NHLBI Percent Effort: 30%
Microtemporal Processes Underlying Health Behavior Adoption and Maintenance.
This study will use real-time mobile technologies to collect intensive longitudinal data examining differences in the micro-temporal processes underlying the adoption and maintenance of physical activity, low sedentary time, and sufficient sleep duration. We will conduct a prospective within-subject case-crossover observational study across a 12-month period among ethnically-diverse, emerging adults (ages 18-24). We will collect intensive longitudinal data using intermittent, real-time self-report and continuous, sensor-based passive monitoring with smartwatches and smartphones to predict within-subject variation in the likelihood of behavior episodes and lapses.
Role: Principal Investigator
Total Direct Costs: \$2,020,416
2. R01CA240713. (Dunton, Hedeker) 7/01/2019-6/30/2023
NIH/NCI Percent Effort: 30%
Novel Statistical Models for Intensive Longitudinal Analyses of Cancer Control Behaviors.
This study will develop and apply multilevel statistical models and software for estimating effects of intraindividual means, variances, slopes of intensively time-varying variables on cancer control outcomes. It will also test usability, develop supporting materials, and disseminate the statistical software. We will test these models by conducting secondary analyses of data from three Intensive Longitudinal Data (ILD) studies of cancer control outcomes with combined sample size of 94,892 occasions nested within 643 people.
Role: Principal Investigator
3. P50ES026086. (Dunton, PI on Project 2) 9/1/2015-NCE
NIH/NIEHS Percent Effort: 15%
Environmental Exposures, Stress, and Maternal Pregnancy-Related Weight Outcomes.
Project 2 of the MADRES Center will examine the cumulative effects of multiple pre- and postpartum chemical environmental exposures, coupled with exposures to social stressors, on excessive gestational weight gain and postpartum weight retention through altered psychological and behavioral responses. Results will identify key mechanistic targets for policy, clinical, and programmatic intervention. Given the serious long-term health consequences of excessive gestational weight gain and postpartum weight retention for both mothers and children, this study could have broad-reaching public health impacts.
Role: Principal Investigator
Total Direct Costs: \$2,121,215
4. Zumberge Interdisciplinary Large Grant. (Dunton) 7/01/2018-NCE
USC Office of Research Percent Effort: 0%
Affective Influences on Cancer Control Behaviors.
We propose a transdisciplinary program of research to elucidate common affective (emotion-based) mechanisms that underpin a diversity of cancer control behaviors. This research program will converge principles and methods of affective neuroscience (USC Brain and Creativity Institute (BCI), led by co-PI, Dr. Antonio Damasio in Dornsife), addiction science (USC Health, Emotion, and Addiction Laboratory [HEAL], led by co-PI, Dr. Adam Leventhal at Keck), and health behavior research (USC Real-time Eating, Activity, and Children's Health [REACH] Lab, led by PI, Dr. Genevieve Dunton at Keck).
Role: Principal Investigator
Total Direct Costs: \$84,660

5. *Cancer Control Program Seed Grant. (Dunton)* 12/01/2018-NCE
 USC Norris Comprehensive Cancer Center Percent Effort: 0%
Affective Influences on Cancer Control Behaviors.
We propose a transdisciplinary program of research to elucidate common affective (emotion-based) mechanisms that underpin a diversity of cancer control behaviors. This research program will converge principles and methods of affective neuroscience, addiction science, and health behavior research.
Role: Principal Investigator
Total Direct Costs: \$25,000

The aim of the proposed study is to test whether, as predicted by TST, delayed discounting mediates adherence to physical activity (PA) recommendations in WLM interventions and whether environmental factors moderate this relationship. PA is the behavior of focus as it is a robust predictor of WLM success and can be measured objectively in the natural environment. This work is novel because it will use an experimental medicine approach to establish whether DD is engaged by a behavioral WLM intervention that explicitly targets DD through the use of episodic future thinking, a visualization procedure that shows promise in amplifying the value of long-term rewards, thus reducing DD.

The Use of Refundable Tax Credits to Increase Low Income Children's After-School Physical Activity Level.
The goal of this study is to ascertain how California state government could address the childhood obesity problem by using the tax system as a tool to promote children's after-school physical activity level, particularly among low income children. Specifically, this project will examine the extent to which a refundable tax credit could influence participation rate in after-school physical activity programs and body mass index (BMI).

Specific aims of project (Project 3): (1) To assess the association between the built environment and obesogenic trajectories during childhood growth and development; and (2) to examine whether individual (i.e., race, SES) and contextual variables (i.e., air pollution) modify the association between the built environment and obesogenic trajectories.

Using real-time data capture to examine affective mechanisms as mediators of physical activity adherence in interventions

Long-term maintenance of regular physical activity significantly lowers risks of cancer and chronic diseases. Public health guidelines recommend combinations of activity intensity, frequency, and duration to achieve a "dose" of at least 150 min/week of moderate-to-vigorous intensity physical activity. While this approach aims to produce measurable health benefits, it fails to address emotional experiences (i.e., how people feel) during behavior, which may contribute

to long-term sustainability. This early-phase trial will test intervention strategies to influence affective mechanisms underlying physical activity and determine whether changes in those mechanisms result in change in physical activity behavior among inactive adults who are overweight or obese.

Acute and Long-Term Cardiometabolic Effects of Occupational Physical Activity in Low-Income Hispanic Postpartum Women

This project will examine longitudinal and acute effects of occupational physical activity on cardiometabolic risk in ongoing cohort of low-income, primarily Hispanic postpartum women. Findings will inform the development of physical activity guidelines, clinical recommendations, and interventions that differentiate between occupational and leisure time physical activity. Given the lifelong benefits of promoting cardiometabolic health during the postpartum period, especially among socioeconomically-disadvantaged populations, **this study could have broad-reaching public health impact**
